

Dashed Lines

- Any path can be converted into a dashed line by checking the dashed line box in the stroke panel.

- The weight or thickness of the line can be adjusted in the drop down. You can choose a number from the drop down, use the arrows to increase/decrease the number by one or type in a number.
- Keeps a consistent distance between dashes
- Aligns dashes to corners or end points adjusts dashes to fit.

- Having a single number here will keep a consistent size in the dashes. Adding more numbers can give you varied dashes. A higher point size makes larger and fewer dashes. A lower pt size creates smaller but many dashes.

20 pt — — —

2 pt

- Cut with scissors
- Select area between cuts with white arrow and open the stroke window and dash
